Cyber Security

Why a password manager is a **business essential**

perigonone™

www.perigonone.com.au

If your business is still relying on spreadsheets, sticky notes or people's memories to manage passwords, you're putting **EVERYTHING** at risk.

It's a bold statement, but it's true.

Passwords are the keys to your business. And too many businesses are still locking their digital front door with a flimsy padlock.

Here's a reality check:
Globally, a staggering 30% of people reuse the same passwords across multiple accounts.

That means if one password gets leaked or hacked, attackers could potentially access everything. From your emails and cloud storage to client data and bank accounts.

Now imagine that happening to one of your employees.

Or worse, your whole team.

You don't need to be a cyber security expert to take smart steps toward stronger protection. And one of the smartest, easiest upgrades you can make is using a password manager.

Let's look at why...

The hidden risks **of weak and reused passwords**

We'll start with something uncomfortable but important…

Most people's password habits are terrible.

And when those habits creep into a business, the results can be disastrous.

Think about it: How many times have you used the same password for more than one account? Or written one down in a notebook "just for now"? Maybe you've even shared a login over email or WhatsApp because it was quicker than doing it properly.

These shortcuts feel harmless. Until the worst happens.

Truth is, cyber criminals love weak and reused passwords.

Why?

Because once they get hold of one password (from a leaked database, a phishing scam, or even a guess), they try it everywhere.

This is called credential stuffing. They use the same login details on other websites and systems to see what else they can break into.

And it works far too often.

Globally, 80% of hacking-related breaches are caused by stolen or reused passwords. That means the biggest threat to your business could be something as simple as one weak password.

Here's a common (but real) scenario: An employee uses the same password for their work email and a personal shopping site. That shopping site gets hacked. Now criminals have their password. They try it on the employee's work email… and it works.

Suddenly, they have access to sensitive messages, shared files, and maybe even client information. That's how reputations – and bank accounts – get damaged fast.

Even writing passwords down in a notebook or saving them in a Word doc isn't safe. If someone steals that device or gains access to your files, they've got everything they need.

These aren't just "IT problems." They're business problems. Security, productivity, customer trust, it's all on the line.

The good news?

You can fix this.

And it doesn't require hiring an expensive consultant or locking everything behind complicated systems. You just need a smarter, safer way to manage your passwords.

What a password manager does **(and why it's better)**

Let's be honest, the term "password manager" might sound like yet another complicated tech tool you'll never understand or use.

But it's not.

In fact, it does exactly what the name suggests. It manages your passwords, safely and smartly, so you don't have to.

Here's how it works in plain English:

A password manager is a secure app that stores all your passwords in one place. But unlike a notebook or browser, it encrypts everything. That means no-one can access your passwords without the master password.

It also creates strong, random passwords for you. No more using your dog's name with a few numbers. These are proper, hacker-proof passwords that look like nonsense to us but are exactly what you need to stay secure. And you don't need to remember any of them. The password manager does that for you.

Better still, it autofills your logins. So, when you visit a website or open an app, your password manager can instantly fill in your details, saving you time and hassle. It's quicker than looking up a password, typing it in, or resetting it because you've forgotten it (again).

You might be wondering, "But what if someone gets into the password manager itself?"

That's a fair question.

Good password managers use end-to-end encryption, which means only you can see your data. Even the company that makes the app can't access your password vault.

Many also support multi-factor authentication (MFA), which adds an extra layer of protection beyond just a password. Think of it like a double lock on your front door.

Here's what this means for your business:

- **Every employee can have their own secure vault of passwords**
- **Shared accounts can be shared safely without emailing login details**
- **No one needs to remember (or reuse) passwords ever again**

In short, a password manager takes the most frustrating part of digital life (keeping track of dozens of logins) and turns it into something easy, secure, and automatic.

The business benefits: **Security, productivity, peace of mind**

Using a password manager isn't just about stronger security (although that's reason enough). It's also one of the simplest ways to improve how your business works, day to day.

First, there's the obvious benefit: **Better security.**

A password manager makes it easy to generate and use long, unique passwords for every account. It's something most people know they should do… but don't.

And because the app remembers everything for you, there's no temptation to reuse passwords or write them down. This dramatically lowers the risk of hackers getting in.

It also gives you control. With a business password manager, you can see who has access to what. If someone leaves the company, you can revoke access instantly, without guessing which logins they knew. No more hunting through old spreadsheets or shared documents trying to piece it together.

Second, you'll save time. A surprising amount of it.

Think about how often someone on your team forgets a password and asks for a reset. Or how long it takes to share login details securely with a new hire. Or how many times you've had to wait for someone to "just check their notes" before logging into a tool.

A password manager removes all that.

Logins are autofilled. Passwords are shared securely with the right people. And help desk requests go down, because no one's locked out anymore.

Third, it reduces stress for you and your team.

No more worrying about whether someone's using "Password123" again. No more scrambling to reset logins in a rush. You know everything's stored safely, shared properly, and protected with strong encryption.

That kind of peace of mind is priceless. Especially when you're juggling everything else it takes to run a business.

And the best part?

Once it's set up, a password manager runs quietly in the background. It does its job so your people can do theirs, without roadblocks, security scares, or password fatigue.

How to choose **the right password manager for your business**

By now, you're probably thinking, "Okay, this all sounds great, but how do I know which password manager is right for us?"

That's a good question. The answer depends on your business's size, needs, and the way your team works.

But there are a few key features you should look for. Especially when choosing a tool designed for businesses.

Look for a business plan, not a personal one

Many password managers offer personal versions, but they won't give you the tools to manage a team.

A business plan lets you do things like create shared vaults for teams, control who has access to what, and monitor use. These features are essential for keeping things organised and secure as your company grows.

Make sure it has admin controls

You should be able to assign different access levels to different people. For example, a manager might need access to a client's files and logins, while a junior team member doesn't.

Admin controls give you the power to manage this easily, and make sure no one sees more than they should.

Encrypted password sharing is a must

You want to be able to share login details with your team without sending them over email, chat, or text.

A good password manager will let you share passwords in a secure, encrypted way. It will even set limits so people can't view or change them if they don't need to.

Bonus points for MFA integration

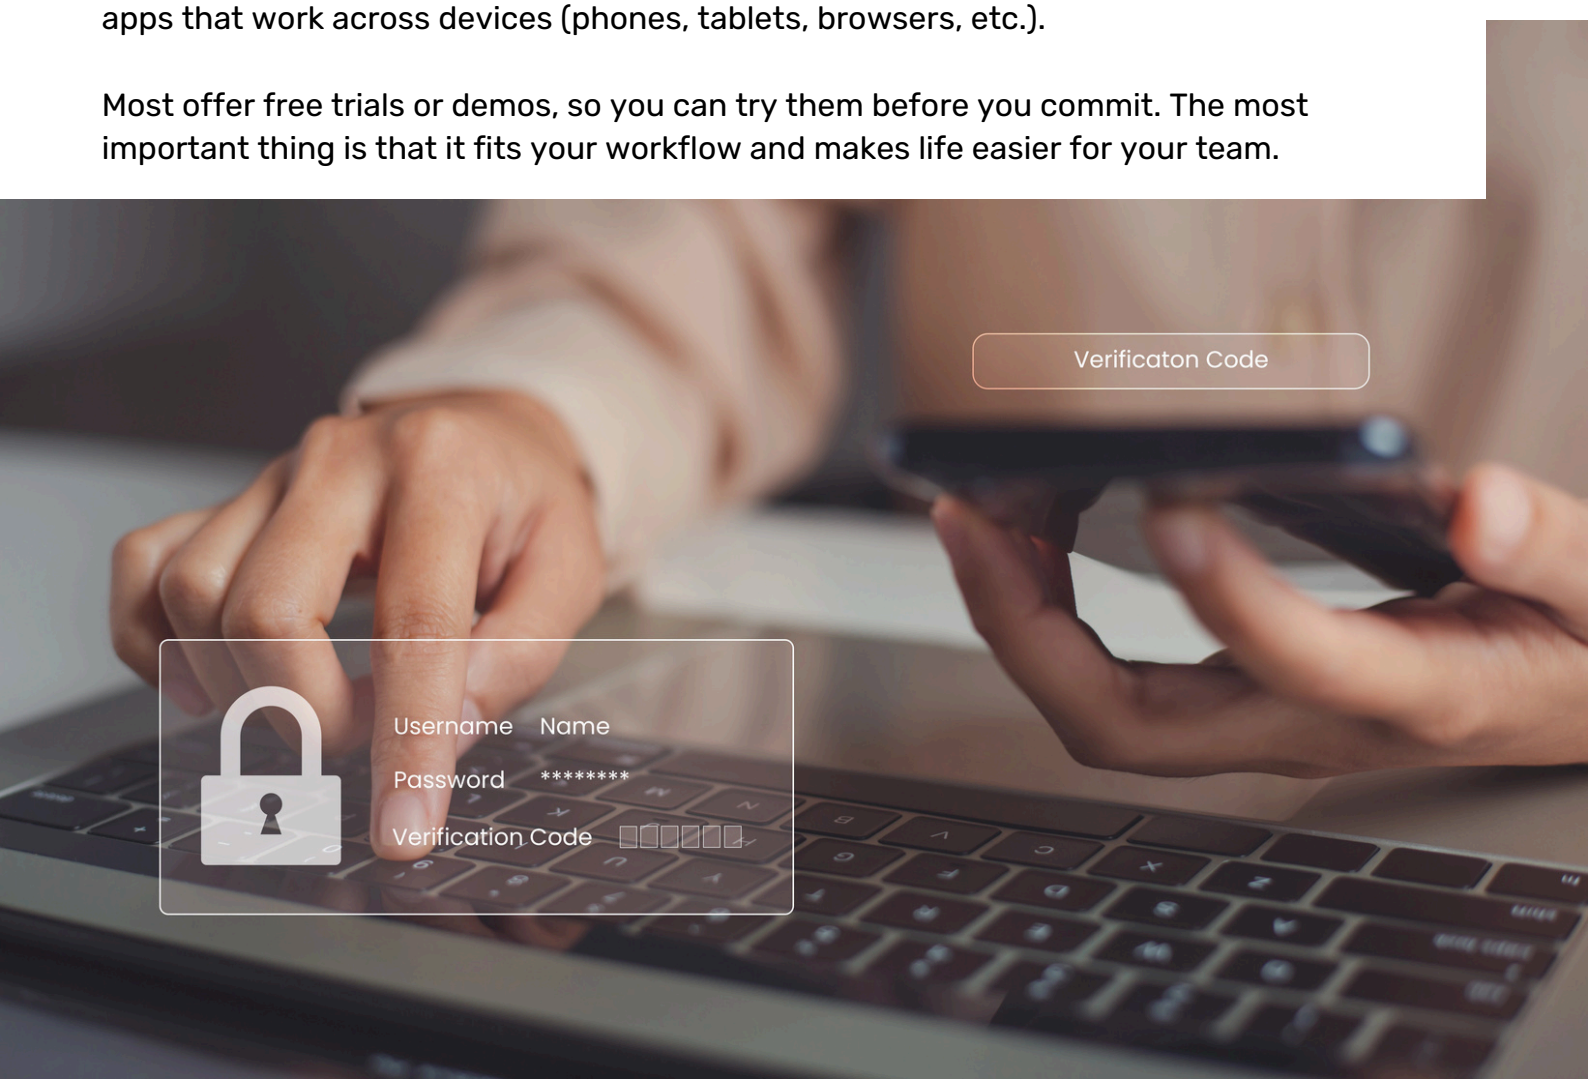
Many password managers let you turn on extra security with MFA. That means even if someone guesses or steals your master password, they still can't get in without a second step, like a code from your phone.

And of course, it should be easy to use

Your team won't adopt a tool that feels confusing or clunky.

Look for a password manager with a clean, simple interface, good support, and apps that work across devices (phones, tablets, browsers, etc.).

Most offer free trials or demos, so you can try them before you commit. The most important thing is that it fits your workflow and makes life easier for your team.



Getting your team on board: **Advice for a smooth rollout**

Introducing a new tool to your team – especially one that changes the way they log in to everything – can feel like a big ask.

But with the right approach, rolling out a password manager can be quick, painless, and even welcomed.

Here's how to do it without pushback...

Start with the why

People are far more likely to use something if they understand why it matters.

Explain the risks of weak passwords (like we covered earlier), and how easy it is for one bad habit to lead to a serious breach. Then show them how a password manager takes the stress out of remembering dozens of logins.

You're not adding work, you're removing it.

Choose a champion (or two)

If you have a tech-savvy team member or someone who's naturally curious, involve them early. Let them test the password manager first, ask questions, and get comfortable.

They can help others get set up later, and having a peer guide the process often makes people feel more at ease than hearing it from "IT."

Offer simple training

You don't need a big training session. A short demo or walkthrough is enough. Show them how to log in, how to save a password, and how to use the autofill feature.

Many password managers offer ready-made videos or guides you can share with your team.

Make it part of your policy

To get full protection, everyone in your business needs to be on board. Add the password manager to your company's IT policy. Set expectations that it must be used for all work-related logins.

Make it clear that shared passwords should only be shared using the app. Never over email or chat.

Be available for questions

The first week or two is when people are most likely to need help. Be available to answer questions or assign someone who can.

Most hiccups are simple, like logging into the wrong browser profile or forgetting the master password setup process.

Once people realise how much time they're saving (and that they never have to click "forgot password" again) they'll wonder how they ever worked without it.

A password manager might not seem like a big deal at first glance. But it's one of the most effective, low-cost upgrades you can make to protect your business, support your team, and simplify everyone's workday.

Smart businesses don't leave security to chance. They build it into how they work, quietly, consistently, and confidently. And this is a great place to start.

We're on hand to help you choose the right password manager, and to get you set up.
